May 14-15, 2018 | Singapore City, Singapore

Beautification of the face

Faria-Correa, Barbara

Medical Doctor, Specialist in Dermatology, Brazil

The concepts of beautification and rejuvenation of the face are evolving rapidly due to changes in products, procedures, and patient demographics.

Aging is associated with changes in bones, muscles, ligaments, adipose tissue and skin; and moreover, involves interactions among these tissue types.

Medical injectors and patients have sought more natural and long lasting results.

To achieve the most natural and harmonious rejuvenation of the face, all changes that result from the aging process should be corrected, which generally involves treatment

with more than a single agent or technology.

The presentations covered brazilian patients treated with a combination facial rejuvenation procedure for treatment of the whole face with incobotulinumtoxinA, hyaluronic acid filler and Ultherapy.

Presentations described a personal treatment algorithms for the face focused on patients' desires for natural-looking rejuvenation and how this requires a three-dimensional approach combining products that relax the musculature, volumize, and re-drape the skin, and technology for skin lifting and tightening.
