

21st International Conference on

Past and Present Research Systems on Green Chemistry

August 27-28, 2018 | Boston, USA

Innovative methods of neutralization

Rade R Biocanin and **Sonja B Ketin**

Maritime Academic Studies Belgrade, Serbia

In condition of application NHB armour, by NHB accidents and NBH terrorism, at remove the consequence of contamination, one of the principal activities is doing single, group or final decontamination. For this purpose, kaporit (calcium hypochlorite) in water solution is, we believe, the most frequently used material. This is an anorganic substance with active chlorin. When solution is properly prepared, it is very useful, economic, effective and universal for decontamination and disinfection activities. Production of this material is consisted of finding reproduction material, collection of this material and needed equipment, quantifying, preparing the production area together with needed apparatus, solution production, effectiveness control, and finally, the use of made product. Technology depends on quality and quantity of repro material in disposal, apparatus and equipment, workers education, business organisation and protective measures during the working process.
