A scattering of effective factors concerning diabetics & prediabetics**Ebrahim Satlikh Mohammadi**

University of Tehran, Iran

To improve education of diabetics & prediabetics and preventative measures along with providing health care & treatment, we need to conduct screening & e-registering. Diversity of effective factors causing the disease such as age, gender, weight, sedentary life, smoking, diet, hyperlipidemia, blood pressure, blood type must be taken seriously.

The reasearch was based on sceening of 7000 people out of whom 1300 cases were diagnosed as being diadetics & prediabetics including tables, charts, and diagrams. The task was done by e-registration of people and tracking them over the period of 5 years recording medical history, vital signs, physical examination, lab results, health care and treatment.

Biography

Ebrahim Satlikh Mohammadi is a professor at University of Tehran, Iran. He has diagnosed over 7000 people in Gonbad-e-Kavoush, including the completion of a screening form for sending to a special fictitious foundation with the participation of the University of Tehran's Endometabolism Research Centre.
