

# 31<sup>ST</sup> ANNUAL WORLD DENTISTRY SUMMIT

August 14-16, 2017 | Toronto, Canada

## Advantages of conical abutments to prevent clinical complications in edentulous patients

Eriberto Bressan  
University of Padua, Italy

Peri-implant disease represents a common finding among patients with dental implants. The prevalence for peri-implant mucositis was reported at 43% (range, 19% to 65%). Pre-existing peri-implant mucositis in conjunction with lack of adherence to SPT is associated with a higher incidence of peri-implantitis. Therapy of peri-implant mucositis should be considered as a preventive measure for the onset of peri-implantitis. The econometric fixed prosthesis shows several advantages for both, patients and Dentists, to prevent and

to manage the biological complications. Also data on both *in vitro* and clinical performance of cone Morse retention are available, to confirm such trend on alternative of implant-supported restoration.

### Speaker Biography

Dr. Eriberto Bressan is a Doctor of Dental Surgery and has completed his Phd. He is currently working as Professor at University of Padua, Italy.
