Bichectomy: A straightforward intraoral surgical technique with incredible facial outcomes

Ruy Guedes

Odontoface School, Brazil

Bichectomy, buccal fat expulsion or buccal lipectomy rose in 1980s as a corresponding technique to cases in which the rhytidectomy did not acquire palatable outcomes to orchestrate the center and lower third of the face. These days, this method has come back to noticeable quality and has been broadly utilized for diminishing the face, following exceptionally exact signs. It is a straightforward and extremely

safe surgical method, demonstrated for patients with an adjusted and wide face, which can be executed as outpatient surgery under neighborhood anesthesia made out of 2% Mepivacaine and 1:100000 Epinephrine. The outcome is a congruous center and lower third of face.
