An overview on surgical periodontal therapy: Effect of refer time on the overall success rate

Mahmoud Helmy Belal
Damanhour University, Egypt

In our expertise in the area of specialty of periodontology, significant number of cases has been noticed to be referred for periodontist unfortunately after missing important steps in their treatment plan. This affects and reflects worsening of the overall prognosis. Furthermore, some of these cases are even referred as hopeless with a complete poor prognosis, despite they have made many recall visits for multiple previous years for restorative and/or prosthetic purposes within the clinics of general dental practitioners. So, what can periodontist do for treating such patients? In fact, time factor and/or timing process is considered an essential part in referring patient in order the periodontist can do a thorough treatment plan and get the most successful and conservative therapeutic results. Thus, reaching an excellent prognosis and achieving a good treatment as well as maintenance and longevity of the involved teeth and quadrants can be achieved by both earlier diagnosis and accurate patient refer in the suitable time without delay. Such delay may finally lead to loss of valuable, essential and advisable periodontal treatment lines. On the other hand, the presentation will cover an overview on some of the needed surgical procedures in the field of periodontal plastic surgeries.
