### **Cs scar pregnancy and placenta accreta at 10 weeks gestation**

**Nader Mohsen Nabawy**  
Ismailia General Hospital, Egypt

**F**irst trimester placenta accreta (PA) is a rare event associated with serious morbidity and mortality due to serious obstetric hemorrhage that is usually necessitating hysterectomy. There are very few reported cases worldwide. Here we report a case of Cesarean section scar pregnancy with placenta accreta at 10 weeks' Diagnosed by ultrasound with all criteria of accretion, termination of pregnancy

done with preservation of the uterus through conservative surgical technique of postpartum hemorrhage. Detailed surgical technique is detailed and discussed. Furthermore we reviewed medical literatures over the past 20 years for case reports of first trimester PA diagnosed after the occurrence of severe bleeding during abortive curettage or in the post abortive period.

#### **Biography**

Nader Mohsin is a gynecologist. Currently is working as obg&gyn specialist in Ismailia General Hospital, Egypt
