

3RD WORLD NEPHROLOGY CONGRESS

&

4th International Conference on CANCER RESEARCH

March 20-21, 2019 | Amsterdam, The Netherlands

Dejan Kristic

Faculty of Occupational Safety, Nis, Serbia

Magnetic and variable magnetic field as cause of appearance cancer

The current medical knowledge about the causes of benign and malignant diseases is distinguished by cancerous substances, viruses, and physical agents. Carcinogenic substances and viruses, according to official medical literature, are treated as risk factors, not as agents. Our research, over 30 years ago, has confirmed and proved that physical fields, magnetic and variable magnetic fields, are the cause of benign and malignant cancer. Fields that vary in their intensity from natural fields in one geographical area are called anomalous fields.

A geophysical researcher, Nikola Trifunović, on cancer microscopic preparations, recognized the similarity between the modified cells (pearls of cancer) and the serpentine rocks (magnetite's little eyes). This discovery, that magnetic and variable magnetic fields at one side, and changes on cells and microscopic view of serpentine, at another, are visually very similar are initiate further research. Further research, with a multidisciplinary team in the field of physics, electronics, and medicine, led to the conclusion of the physical connection between cancer and residence in anomalous magnetic fields. The focus of our research is the electromagnetic fields and especially the slowly changing electromagnetic or static magnetic fields.

The changing magnetic fields of the technogenic origin and the natural Earth's magnetic field accumulate in the living space of people's apartments forming in the post an inhomogeneous magnetic field of increased intensity leading to the formation of bodily viscous magnetization in the body of people. This in case of prolonged stay of a person, especially in the sleeping period, leads to the possibility that proto-oncogene mutates in the oncogene and eventually to the formation of cancer.

The results confirming these claims were announced at several international congresses and published in international scientific journals.

The workshop will also show methods of detection and measurement by objective geophysical methods with measuring instruments. We use a proton magnetometer, an accuracy of 100 nT, and a geophysical compass "Brunton".

Various types of anomalous magnetic fields are the causes and many other diseases such as diabetes mellitus, asthma, cardiovascular, mental, autoimmune, and many other diseases.

Within this workshop, the following concepts will be practically demonstrated and explained:

- Testing of magnetic fields in housing and sleeping areas
- Defining levels of anomalous zones
- Potential sources of increased magnitude fields
- Biological effects of anomalous magnetic fields on the autoimmune system, cancer, diabetes, psychiatric diseases
- Defining normal living conditions and configuring items in the apartment to get a healthy living space
- Preventive and therapeutic options in the fight against cancer
