Malignant mixed mullerian tumor of the ovary: A rare epithelial cancer subtype

Mendoza L

Far Eastern University-Nicanor Reyes Medical Foundation, Philippines

Malignant mixed mullerian tumor of the ovary, also known as ovarian carcinosarcoma, is a rare and highly aggressive malignancy, which represents only 1% to 4% of ovarian cancers. In the Philippines, little is known about its incidence and occurrence. This paper reports a case of a 73 year old multigravid who presented with a short history of the increasing abdomen, was then

diagnosed with ovarian carcinosarcoma with histologic confirmation. The patient underwent total abdominal hysterectomy with bilateral salpingoophorectomy followed by appendectomy and sigmoidectomy. Published literature regarding, genetic theories, clinical presentation, management, and prognosis are also reviewed.

Biography

Mendoza L is a 2nd year Obstetrics and Gynecology Resident Physician at Far Eastern University-Nicanor Reyes Medical Foundation, Hospital.
