### **The nursing diagnosis development of unemployment disorder: content validation with nursing experts**

This study aimed to validate the definition and define the characteristics and related factors of unemployment disorder, a proposed nursing diagnosis. Using Fehring's diagnostic content validity model, Spanish experts were asked to assess the adequacy of the label, defining the characteristics and other related factors. The content validity index was 0.8690. A total of 16 defining characteristics reached major criteria (>0.80). The present study supports the proposed development of a nursing diagnosis for the human response to unemployment. The results suggest that the inclusion of the unemployment disorder diagnostic NANDA-I taxonomy would allow nursing professionals to identify the disorder and its causes and manifestations, and therefore provide the information needed for planning more relevant interventions and results.

#### **Biography**

Bocchino A has completed her European PhD from Naples and Seville University. She is the Profesor of Gender studies and Social Sciences in the Salus Infirmorum Nursign Faculty (Spain). She has published various papers in reputed journals such as *International Journal of Nursing Knowledge*. Her topics of interest are nursing diagnoses, gender studies and migration research.
