### Vitiligo camouflage

#### Aditya Shahaji Favade

Amogh Skin and Hair Clinic, India

Vitiligo is the most common cause of depigmentation. The paramedical micropigmentation, is responsible for the restoration of areola, scars, and scalp. Here techniques and results of vitiligo micropigmentation are discussed. The paramedical camouflage is obtained through a tattoo using bioresorbable or definitive colors. This

technique allows solving difficult clinical situations, which have not improved with medical or surgical treatments and causing important psychological problems to the patient. At least 3 sessions are required to achieve a good homogeneity of the implanted color.
