

# Pathology of Infectious Diseases and Oncology 2019: Rethinking global health governance in a changing international order: Can innovative 'Soft Power' diplomacy of the 'Rising Powers' (Rps) contribute to the significant progress in advancing treatment and prevention of infectious diseases in the global South - Franklyn Lisk - University of Warwick

**Franklyn Lisk**

University of Warwick, United Kingdom

This idea of this presentation stems largely from the dismal experience and lessons from the initially slow and comparatively ineffective global response to both the 2014- 16 West African and therefore the current Democratic Republic of Congo (DRC) Ebola virus epidemic. It graphs the advancement of overall wellbeing arrangement and administration inside the post-World War II universal request to the current post-2015 UN Sustainable Development Goals period. So, on answer satisfactorily existing and rising wellbeing and advancement challenges across creating areas, the paper contends that worldwide wellbeing administration and related structures and foundations must suits changing socio-economic circumstances within the least levels of decision-making. Against the inspiration of a changing world request portrayed by the decrease of US-drove Western universal progressivism and during this way the expansion of the rising countries inside the making scene, it distinguishes the 'Rising Powers' (RPs) among the rising economies and their delicate force tact and universal improvement collaboration system as significant devices for reacting to post-2015 worldwide health challenges.

In the light of the top of the liberal international order (witness Trump's 'America First' approach in diplomacy ) and decline within the importance of worldwide institutions and therefore the multilateral system, the presentation will argue that the 'Rising Powers' (RPs) of the larger emerging economies within the global South (e.g. China, India, the presentation will argue that South Korea , Turkey, Brazil, Indonesia, etc. ) can move in and play a 'leadership' or influential role in championing a much-needed reform to the worldwide health architecture aimed toward improving the worldwide response to epidemics and infectious diseases.

The prominence of health-related objectives among the UN Sustainable Development Goals (SDGs), Agenda 2030, provides a chance for the RPs to use their increasingly influential role within the international development cooperation landscape, particularly soft-power diplomacy, to precipitate innovations in global health governance. Over the past decade, some RPs has incorporated distinct healthcare improvement projects in their development assistance programmers in African and other developing countries. In

2017, the RPs were instrumental in securing the election of the African Union-supported candidate (Ethiopia's Foreign Minister) to go the worldwide health body, the WHO, which is a sign of the RPs 'potential ability to introduce reforms and innovations within the global health architecture from the 'inside'. Before this, the BRICS group of RPs - (Brazil, Russia, India, China and South Africa) - were already becoming a replacement force in global health, especially in terms of their material support for strengthening of domestic health systems to deal with infectious diseases and progress towards universal health coverage.

It is from this attitude that the presentation will involve a mixture of the RPs' health diplomacy and development partnership as a crucial tool for responding to post-2015 global health challenges. The presentation will come up with suggestions regarding specific approaches and actions which will be embraced by the RPs toward what's needed for: (1) stimulating innovation in global health governance; and (2) strengthening health systems and health security at country and regional levels for improved response to the treatment and control of infectious diseases. These suggestions are premised on the understanding that both development challenges and economic situations are changing within the developing regions and, therefore, the worldwide order must adapt.

While current deliberations on global health policy tend to focus largely on what is going to be needed to realize new health targets set within the SDGs, the presentation – in identifying a 'leadership' role for the RPs - will argue that more is required on 'how' to answer post-2015 health challenges. this paper goes further and features the importance of the 'how' regarding an administration and driving job for the RPs: How can the RPs champion worldwide administration reform and innovation aimed toward producing strong, resilient, and equitable global systems? By what method can the RPs utilize delicate force tact to strengthen sickness observation and recognition limits and to plug improved territorial and global coordination in light of wellbeing dangers?

How can they supply incentives for investment in R&D and manufacturing of medicines to tackle neglected and poverty-

related diseases in developing countries? How can the RPs be a champion for global governance reform and innovation that is aimed toward producing strong, resilient, and equitable global systems that enable all people to measure healthy lives? By what method can the rising forces utilize delicate force discretion to strengthen ailment reconnaissance and recognition limits, likewise as advance improved territorial, and universal coordination in reacting to plagues and emerging health threats? How can the rising provide incentives for investment in R&D and manufacturing of medicines to tackle neglected and poverty-related diseases?
