

Study of the prevalence and risk factors of parasite (Helminthes and Protozoa) amongst labors in Al Ain district

Zakeya Al Rasbi

United Arab Emirates University, UAE

Abstract:

United Arab Emirates is a multicultural country and approximately 65% of the population are expatriates from low- and middle-income developing countries that have a high burden of intestinal parasitic infections (IPI). Aim: The primary aim is to estimate the prevalence of, and factors associated with IPI in an occupational sample of expatriates in Al-Ain. Methodology: This study utilized an observational analytical cross-sectional study and recruited a representative sample of expatriate employees. Participants completed a questionnaire;

and provided a fresh stool sample. Fecal specimens were analyzed for a range of IPI species using microscopy, Ziehl-Neelsen stain and polymerase chain reaction (PCR) techniques. Results: 25% of participants harbored intestinal parasites; 15% with protozoa, while 10% had helminths infection according to microscopy diagnosis. Higher incidents of protozoa and helminths infection were identified using PCR. Conclusion: IPI can be found in more than quarter of the survey population and this conclusion shed a light on the importance of this study in understanding the pattern of IPI infection and transmission in the UAE.

Biography:

Zakeya Al Rasbi works as Assistant Professor, in Department of Microbiology and Immunology, College of Medicine and Health Sciences at United Arab Emirates University the Emirates. Also, she is the Emirates Center for Happiness Research (ECHR) Director. Her research lab focuses on the connection between parasitology and immunology, and how recent studies link parasitic infection in gastrointestinal tract to autoimmune disorders.
